**Additional
Information**

Suggested QC flag from Data Provider: NA

Additional Comments: The analytical system operated well during the cruise. For the last 1.5 hours of the cruise, the ship's sensors were not recorded; and during the entire cruise, the barometer was recorded with only 1 mbar resolution. Missing SST values were estimated by subtracting 0.39 degrees from the Equilibrator temperature. For the prior 4 days of this cruise, the average difference between the SST and Equilibrator temperature is 0.39 (+/- 0.07) degree Celsius. To obtain better than 1 mbar resolution, all barometric pressure values were estimated by subtracting 0.04 mbar from the LICOR pressure. For the 1.2 days of the WS19113 cruise (ExpoCode 33WA20190423), the average difference between the barometric and LICOR pressures is 0.04 (+/- 0.09) mbar. Missing salinity values were estimated from adjacent measured values. Original Data Location: http://www.aoml.noaa.gov/ocd/ocdweb/wsmith/wsmith_introduction.html . Full unprocessed data files from analytical instrument including flow information plus meteorological and TSG data at time of sampling can be obtained upon request.
