## Abstract

Binned-profile CTD data from cruise KM1312 during July 2013. Data were processed with Sea-Bird SBE Data Processing Version 7.21K.

## Dataset Description

Binned-profile CTD data from cruise KM1312 during July 2013. Data were processed with Sea-Bird SBE Data Processing Version 7.21K using windows and filters as described below.

## Acquisition Description

Note: some cast numbers may be missing/skipped for a given station because of aborted casts.

### Header information from Sea-Bird SBE 9 Data File:

Software Version Seasave V 7.21k

Temperature SN = 1489; Conductivity SN = 1176

Number of Bytes Per Scan = 41; Number of Voltage Words = 4

Number of Scans Averaged by the Deck Unit = 1

SBE 11plus V 5.2

number of scans to average = 1; pressure baud rate = 9600; NMEA baud rate = 4800

GPIB address = 1

advance primary conductivity 0.073 seconds

advance secondary conductivity 0.073 seconds

## Processing Description

The processed data files submitted to BCO-DMO include 2 plots for each cast: plot 1 contains

temperature, oxygen, PAR, and density vs. pressure; plot 2 contains fluorescence, salinity, beam attenuation, and density vs. pressure. Plots have been compiled into a single PDF file:

[POWOW3 CTD Plots \(58.9 MB PDF\)](#)

BCO-DMO obtained the processed .cnv files (binned profiles) and replaced values of '-9.990e-29' with 'nd' to indicate 'no data'. Parameter names were modified to conform with BCO-DMO convention. month\_utc, day\_utc, year, time\_start, lat\_start, lon\_start, and depth\_w were taken from the .cnv file headers and the scanned CTD cast logs.

## Parameters

Parameter	Description	Units
CTD_num	CTD number (sequential for the cruise).	unitless
station	Station number (sequential based on location).	unitless
cast	Cast number (sequential; starts at 01 for each new location/station number). Some cast numbers may be missing/skipped for a given station because of aborted casts.	unitless

month_utc	2-digit month of year, UTC, at start of cast.	mm (01 to 12)
day_utc	2-digit day of month, UTC, at start of cast.	dd (01 to 31)
year	4-digit year at start of cast.	YYYY
time_start	Time (UTC) at start of CTD cast, 24-hour clock.	HHMM
lat_start	Latitude at start of CTD cast. Positive = North.	decimal degrees
lon_start	Longitude at start of CTD cast. Positive = East.	decimal degrees
depth_w	Depth of the water (bottom depth).	meters
ISO_DateTime_UTC	Date/Time (UTC) ISO8601 formatted. T indicates start of time string; Z indicates UTC.	YYYY-mm-ddTHH:MM:SS.ssZ
press	Pressure, Digiquartz.	decibars
temp	Temperature from primary sensor, ITS-68, measured in degrees Celsius.	degrees C
temp2	Temperature from secondary sensor, ITS-68, measured in degrees Celsius.	degrees C
cond	Conductivity from primary sensor measured in Siemens per meter.	S/m
cond2	Conductivity from secondary sensor measured in Siemens per meter.	S/m
O2_umol_kg	Oxygen measured by primary SBE 43 sensor in micromoles per kilogram.	umol/kg
O2_umol_kg2	Oxygen measured by secondary SBE 43 sensor in micromoles per kilogram.	umol/kg
fluor	Fluorescence measured by WET Labs ECO-AFL/FL in milligrams per cubic meter.	mg/m <sup>3</sup>
fluor_spt	Fluorescence, Seapoint.	?
sal	Salinity from primary sensor in practical salinity units.	PSU
sal2	Salinity from secondary sensor in practical salinity units.	PSU
sigma_0	Sigma theta density from primary sensor in kilograms per cubic meter.	kg/m <sup>3</sup>

sigma_0_2	Sigma theta density from secondary sensor in kilograms per cubic meter.	kg/m <sup>3</sup>
potemp	Potential temperature from primary sensor, ITS-90, measured in degrees Celsius.	degrees C
potemp2	Potential temperature from secondary sensor, ITS-90, measured in degrees Celsius.	degrees C
beam_c	Beam attenuation measured by the WET Labs C-Star transmissometer.	1/m
par	PAR/Irradiance, Biospherical/Licor	?
nbin	Number of scans per bin.	unitless

[ [table of contents](#) | [back to top](#) ]

## Instruments

<b>Dataset-specific Instrument Name</b>	LI-COR Biospherical PAR
<b>Generic Instrument Name</b>	LI-COR Biospherical PAR Sensor
<b>Generic Instrument Description</b>	The LI-COR Biospherical PAR Sensor is used to measure Photosynthetically Available Radiation (PAR) in the water column. This instrument designation is used when specific make and model are not known.

<b>Dataset-specific Instrument Name</b>	CTD SBE 9
<b>Generic Instrument Name</b>	CTD Sea-Bird 9
<b>Generic Instrument Description</b>	<p>The Sea-Bird SBE 9 is a type of CTD instrument package. The SBE 9 is the Underwater Unit and is most often combined with the SBE 11 Deck Unit (for real-time readout using conductive wire) when deployed from a research vessel. The combination of the SBE 9 and SBE 11 is called a SBE 911. The SBE 9 uses Sea-Bird's standard modular temperature and conductivity sensors (SBE 3 and SBE 4). The SBE 9 CTD can be configured with auxiliary sensors to measure other parameters including dissolved oxygen, pH, turbidity, fluorometer, altimeter, etc.). Note that in most cases, it is more accurate to specify SBE 911 than SBE 9 since it is likely a SBE 11 deck unit was used. more information from Sea-Bird Electronics</p>

<b>Dataset-specific Instrument Name</b>	SBE-43 DO
<b>Generic Instrument Name</b>	Sea-Bird SBE 43 Dissolved Oxygen Sensor
<b>Generic Instrument Description</b>	<p>The Sea-Bird SBE 43 dissolved oxygen sensor is a redesign of the Clark polarographic membrane type of dissolved oxygen sensors. more information from Sea-Bird Electronics</p>

<b>Dataset-specific Instrument Name</b>	ECO AFL/FL
<b>Generic Instrument Name</b>	Wet Labs ECO-AFL/FL Fluorometer
<b>Generic Instrument Description</b>	The Environmental Characterization Optics (ECO) series of single channel fluorometers delivers both high resolution and wide ranges across the entire line of parameters using 14 bit digital processing. The ECO series excels in biological monitoring and dye trace studies. The potted optics block results in long term stability of the instrument and the optional anti-biofouling technology delivers truly long term field measurements. more information from Wet Labs

<b>Dataset-specific Instrument Name</b>	WL CSTAR Trans
<b>Generic Instrument Name</b>	Wet Labs CSTAR Transmissometer
<b>Generic Instrument Description</b>	A highly integrated opto-electronic design to provide a low cost, compact solution for underwater measurements of beam transmittance. The instrument is capable of either free space measurements, or through the use of an optical flow tube, flow-through sampling with a pump. It can be used in profiling, moored, or underway applications. more information from Wet Labs

## Deployments

KM1312

<b>Website</b>	<a href="https://www.bco-dmo.org/deployment/515629">https://www.bco-dmo.org/deployment/515629</a>
<b>Platform</b>	R/V Kilo Moana
<b>Report</b>	<a href="http://dmoserv3.whoi.edu/data_docs/POWOW/POWOW3-cruise_report.pdf">http://dmoserv3.whoi.edu/data_docs/POWOW/POWOW3-cruise_report.pdf</a>
<b>Start Date</b>	2013-07-01
<b>End Date</b>	2013-07-28
<b>Description</b>	<p>From the cruise report: The POWOW#3 cruise was the third in a series of cruises to study the influence of temperature and other environmental variables on Prochlorococcus, its viruses and other members of the microbial community in the Northern Pacific Ocean. The primary goal of this cruise was to measure the abundance, diversity and activity of Prochlorococcus and associated bacterial and viral communities across temperature (and other environmental) gradients to understand how climate change may impact ocean ecology and biogeochemistry. There are many additional scientific and broader impact goals including characterizing oxidative stress and investigating nitrogen uptake/utilization molecular diversity. The official title of the project is "Collaborative Research: Seasonal and decadal changes in temperature drive Prochlorococcus ecotype distribution patterns" and it is part of NSF #1031064 (Duke) and 1030518 (UTK). Cruise information and original data are available from the NSF R2R data catalog.</p>

## Project Information

### Seasonal and decadal changes in temperature drive Prochlorococcus ecotype distribution patterns (POWOW)

**Website:** <http://oceanography.ml.duke.edu/johnson/research/powow/>

**Coverage:** Eastern North Pacific Ocean

Project also known as 'Prochlorococcus Of Warming Ocean Waters' (POWOW). The two numerically-dominant ecotypes of the marine cyanobacterium Prochlorococcus partition the surface ocean niche latitudinally, with ecotype eMIT9312 dominant in the 30 degree N to 30 degree S region and eMED4 dominant at higher latitudes. These ecotypes may account for 25-50% of primary production in open ocean ecosystems, but this percentage is dependent on

which ecotype dominates. The relative abundance of the two ecotypes follows a log-linear relationship with temperature, with the transition from eMIT9312 to eMED4 occurring at approx. 18 degrees C. From these descriptive data, it has been hypothesized that temperature is the primary driver of relative abundance. Their contribution to net primary production, however, appears to be independent of temperature, suggesting temperature regulates ecotype dominance through photosynthesis-independent mechanisms. To test these hypotheses, the PIs are undertaking a series of field and lab studies to investigate the effect of temperature change on the distribution of these ecotypes. Two cruises in the North Pacific will trace the transitions from eMIT9312- to eMED4-dominated regions, with one cruise during the winter and the other during summer. They have hypothesized that the ratio of ecotype abundance will move latitudinally with the seasonal shift in temperature gradient: migration of the 18 degrees C isotherm northward in the summer will be matched by a similar migration of the 1:1 ecotype transition point. Multiple crossings of the 18 degrees C isotherm are proposed, and the summer cruise will also follow the isotherm to the Western US coast to gain insight on physical and geochemical influences. Environmental variables such as nutrient concentrations, light/mixing depths, and virus /grazing based mortality, which may impinge on the relationship between temperature and ecotype ratio, will be assessed through a series of multivariate analyses of the collected suite of physical, chemical and biological data. Seasonal comparisons will be complemented with on-deck incubations and lab competition assays (using existing and new isolates) that will establish, for the first time, how fitness coefficients of these ecotypes relate to temperature. As latitudinal shifts in temperature gradient and migration of ecotypes during seasonal warming likely share common features with high latitude warming as a consequence of climate change, the investigator's analyses will contribute important biological parameters (e.g., abundances, production rates, temperature change coefficients) for modeling biological and biogeochemical responses to climate change. This research will be integrated with that of committed collaborators, generating data sufficient for ecosystem-scale characterizations of the contributions of temperature (relative to other forcing factors) in constraining the range and seasonal migration of these numerically dominant marine phototrophs.
