31	Title	Effects of long-term exposure to ocean acidification conditions on future southern Tanner crab (<i>Chionoecetes bairdi</i>) fisheries management Demographic models of pre- and post-recruitment population dynamics were developed to account for the effects of ocean acidification on biological parameters that affect southern Tanner crab (<i>Chionoecetes bairdi</i>) larval hatching success and larval and juvenile survival. Projections of stock biomass based on these linked models were used to calculate biological and economic reference points on which fisheries management advice is based and thus provide fisheries managers with strategic advice on the likely long-term consequences of ocean acidification. The models utilized information for southern Tanner crab in the eastern Bering Sea. This information included the monitoring data on which conventional size-structured stock assessments are based, as well as the functional relationships that determine survival based on experiments that evaluated the consequences of ocean acidification over the next 100–200 years on crab larval hatching success, larval survival, and the survival of juvenile crab. The results highlighted that juvenile survival had the largest effect (~20% decrease over 75 years) on biological and economic reference points, while hatching success, particularly if density dependence occurs after hatching, and larval survival have smaller effects (~10% decrease). Catch and profits would be expected to decrease by ~50% in 20 years if natural mortality is affected by ocean acidification. Additional laboratory data on oocyte and embryo development leads to large changes in biological reference points depending on the timing of ocean acidification effects relative to natural mortality. The results highlight the need for experiments to evaluate the longer term physiological effects of ocean acidification on multiple life history stages and to measure indices that directly inform population dynamics models to evaluate future management scenarios.	5
32	Abstract	To Integrate biological model of population dynamics, the results of OA experiments conducted by the NMFS Kodiak Lab, and economic parameters related to costs and prices	6
33	Purpose	To Integrate biological model of population dynamics, the results of OA experiments conducted by the NMFS Kodiak Lab, and economic parameters related to costs and prices	7

340	Var7: Researcher Institution	University of Washington	27.21.2
341	Var8: Variable abbreviation in data files	"F35%"	27.1
342	Var8: Full variable name	Fishing mortality corresponding to a spawning biomass-per-recruit of 0.35	27.2
343	Var8: Observation type	Model Output	27.4
344	Var8: In-situ observation / manipulation condition / response variable	Response variable	27.5
345	Var8: Variable unit	year^-1	27.7
346	Var8: Measured or calculated	Calculated	27.8
347	Var8: Calculation method and parameters		27.9
348	Var8: Sampling instrument		27.10
349	Var8: Analyzing instrument		27.11
350	Var8: Duration (for settlement/colonization methods)		27.12
351	Var8: Detailed sampling and analyzing information		27.13
352	Var8: Field replicate information		27.14
353	Var8: Uncertainty		27.15
354	Var8: Data quality flag description		27.16
355	Var8: Method reference (citation)	Punt, AE, Foy, RJ, Dalton, MG, Long, CW, Swiney, KM. 2016. Effects of long-term exposure to ocean acidification conditions on future southern Tanner crab (<i>Chionoecetes bairdi</i>) fisheries management. ICES J. Mar. Sci. 73: 849-864, doi:10.1093/icesjms/fsv205	27.17
356	Var8: Biological subject	Chionoecetes bairdi Rathbun, 1924	27.18
357	Var8: Species Identification code	98429	27.19
358	Var8: Life stage of the biological subject	Based on all life stages	27.20
359	Var8: Researcher Name	Andre Punt	27.21.1
360	Var8: Researcher Institution	University of Washington	27.21.2
