31	<b>Title</b>	Partial pressure of carbon dioxide (pCO <sub>2</sub> ), temperature, salinity and other variables collected from surface underway observations using shower head equilibrator, carbon dioxide gas detector and other instruments from 6 trans-Pacific crossings onboard container ship Cap Blanche in the Pacific Ocean from 2017-11-17 to 2018-09-04.  Underway measurements of pCO <sub>2</sub> , salinity, sea surface temperature, and other parameters were collected during 4 trans-Pacific crossings in 2016 and 2017 on the container ship Cap Blanche. Cruise names and expocodes: CB2017_11 (AG5W20171117), CB2018_01 (AG5W20180112), CB2018_03 (AG5W20180309), CB2018_05 (AG5W20180502), CB2018_07 (AG5W20180630), CB2018_09 (AG5W20180827). All cruises were transits between the North American West Coast and New Zealand. This effort was conducted in support of NOAA's Climate Program Office (CPO) and Ocean Acidification Program (OAP).	5
32	<b>Abstract</b>	The major objectives of the project were to and to continue a time series documenting the distribution of surface and atmospheric fCO <sub>2</sub> , salinity, temperature, and other parameters, and to characterize and map the key indicators of ocean acidification (OA) across the Pacific Ocean.	6

148	<b>pCO2A: How was temperature inside the equilibrator measured .</b>	Hart Scientific model 1521 digital thermometer, serial number A77488, with an NIST traceable model 5610 thermistor probe, serial number A9B0916. Accurate to $\pm 0.01^{\circ}\text{C}$ .	25.13.6
149	<b>pCO2A: How was pressure inside the equilibrator measured.</b>	Setra 239 differential pressure transducer, accurate to $\pm 0.15 \text{ hPa}$ . The equilibrator was passively vented to a secondary equilibrator, and the Licor sample output was vented to the laboratory when CO <sub>2</sub> measurements were made, thus equilibrator headspace pressure was assumed to be laboratory pressure. Pressure in the laboratory was measured with a GE Druck barometer, serial number 3013024, with an accuracy of $\pm 0.01 \text{ %fs}$ .  From Pierrot, et al.: Sample air is dried in a condenser that is cooled to 4-5 oC by a Peltier thermoelectric device. This partially dried air flushes a chamber that is vented and remains at ambient pressure. The dried air inside the chamber is used as the counter flow in the Nafion® tubing. A vacuum pump pulls the dried air from the chamber first through a fixed restrictor and then through the Nafion® tubes, thus creating an absolute pressure and corresponding partial pressure gradient for water vapor across the membrane. When atmospheric air is measured, some of the partially dried air (80-100 ml/min) is pushed through a Nafion® tube, the analyzer and out a vent instead of flushing the chamber.	25.13.7
150	<b>pCO2A: Drying method for CO<sub>2</sub> gas</b>	The headspace gas, when being measured, is circulated in a closed loop through the analyzer at a rate similar to that of the atmospheric air (80-100 ml/min). It is dried first in the condenser, then in a Nafion® tube prior to entering the analyzer and being returned to the equilibrator. Typically, the water mole fraction ( $x\text{H}_2\text{O}$ ) in the dried gas is about 2 parts per thousand (ppt), which corresponds to a dew point temperature of about -20 °C. The liquid water condensed out of the sample air streams is removed by peristaltic pumps into the vent equilibrator at intervals determined by the user.	25.14

155	<b>pCO2A: Standardization technique description</b>	The system runs a full cycle in approximately 7 hours. The cycle starts with 4 standard gases, then measures three rounds of 6 atmospheric samples followed by 50 surface water samples. Each new gas is flushed through the Licor Analyzer for 2 minutes prior to a stop-flow measurement.	25.16.1
